

How To Clean Filter Sand

It is very important to clean the sand in your filter once a season. The best time to do this is at the end of the season. Changing the sand in your filter should be done **EVERY 3-5 YEARS**. Keeping up with maintenance on your filter is important so that there is less back washing and full pressure required to maintain good circulation.

Cleaning the Filter Sand

1. Dilute a 250 gram bag of **BIOGUARD FILTER BRITE** into a 20 litre pail of water.
2. Turn your pump off and remove lid and basket.
3. Pour solution into the pump pot and replace lid. Please note your pump may not take all of the solution in one pour. By quickly turning your pump on/off, it will empty the pot and allow you to empty remainder of the solution.
4. Turn your pump on/off for a few seconds to empty remainder of the solution and allow the solution to go into the filter.
5. Leave your pump **off** overnight. The following morning turn the dial on your filter to backwash and run the pump for 5-6 minutes to remove the solution from your filter. Rinse your filter for 30-60 seconds.
